

CADENCE SPEECH ASSESSMENT REPORT

Confidential Candidate Analysis

Date: September 6, 2026

CANDIDATE NAME
Aayush Bhardwaj

EMAIL
candidate@example.com

TEST ID
3AF21F85

CEFR LEVEL
B2

1 | Introduction

About This Report

Cadence is an objective speech diagnosis system designed to identify what occurred during delivery, where in the recording it happened, and what targeted drills to practice. The numeric scores are a byproduct of this diagnosis, not the primary output.

Assessment spans five independent axes: Fluency & Rhythm, Pronunciation & MTI, Prosody & Intonation, Stutter & Disfluency, and Vocabulary & Grammar. These dimensions are evaluated separately because distinct issues—such as an L1 phoneme pattern versus an involuntary hesitation—demand different practice regimens.

All dashboard scores are computed deterministically from audio-derived metrics (millisecond timing, pause distribution, and reference alignment)—never estimated by an LLM. Language models are strictly limited to qualitative explanations and coaching guidance.

Score Interpretation

All scores are on a scale of 0–100.

70–100: Proficient

Candidate demonstrates clear, business-ready communication with minimal interference.

30–69: Developing

Candidate is intelligible but demonstrates noticeable issues requiring targeted practice.

0–29: Needs Significant Work

Candidate speech frequently impedes comprehension; foundational training required.
